

Approaches to the semantic definition of logical implication relation

© O.I. Nevdobenko

The article considers two types of definition of the fundamental concept of logic, i.e. the logical implication relation. The first type is associated with the tradition of defining logical implication through the requirements for the inheritance of values. The variability of this approach involves different possibilities of setting a variety of assessments. The second type of definition is related to the computational consecution model.

Keywords: *logical implication relation, non-standard semantics, typology of logics*
